1. See 12 Lead Electrocardiogram (ECG) procedure

2. If unconscious/unstable, defer vascular access until after cardioversion.

3. If conscious, consider analgesia prior to cardioversion: Fentanyl 1 mcg/kg IVP
   - ≤ 65 years of age - max dose 100 mcg
   - > 65 years of age - max dose 50 mcg

4. All patients with wide complex tachycardia should be transported to a STEMI Center

   - For renal patients with suspected hyperkalemia, consider: Calcium Chloride 1 AMP IV/IO (10 ml of 10% solution)
     Sodium Bicarb 1 AMP IV/IO (50 ml [50 mEq] of 8.4% solution)

   - For suspected tricyclic antidepressant overdose consider: Sodium Bicarb 1 AMP IV/IO (50 ml [50 mEq] of 8.4% solution)
